

Integration with Other Systems

Forte Payments

OnCore, a clinical trial management system (CTMS), can be linked to Forte Payments, a payment management system. Integrating OnCore with Forte Payments can help streamline financial management into a single system. Forte Payments can manage the payment process and disbursement by generating payments to study participants, such as compensation for their time or reimbursement for travel expenses.

EPIC

OnCore integrates seamlessly with EPIC, a widely used electronic health record (EHR) system in healthcare organizations. Integrating OnCore with EPIC helps streamline clinical research operations and improve coordination between research and clinical care.

Here are some ways in which OnCore integrates with EPIC:

- *Participant data:* OnCore can import participant data from EPIC, such as demographic information. This can help streamline the participant enrollment process and reduce data entry errors.
- *Visit schedule:* OnCore can schedule study visits in EPIC, which enables clinical staff to view the study visit schedule in the same system where they manage patient care. This can help reduce scheduling errors, out of window visits and improve coordination between study visits and clinical care.
- *Billing:* OnCore can generate patient billing information for procedures and services in EPIC, which helps ensure accurate billing and compliance with regulatory requirements.
- *Safety reporting:* OnCore can send safety data to EPIC, enabling clinical staff to view safety data in the same system where they manage patient care. This can help ensure that safety data is acted upon promptly and that patients are monitored appropriately.
- *Results reporting:* OnCore can export study results to EPIC, which enables clinical staff to view study results in the same system where they manage patient care. This can help ensure that study results are integrated into patient care and that patients receive appropriate follow-up care based on study results.
